

---

Thanks to the **<button>** tag we can  
“define a clickable button”

-w3schools

Yay! I can finally click on this!

---

A proper use of the **<button>** tag  
would look like this:

**<button type="button">Click Me!</button>**

---

---

# Additional Information

If you wish to add additional information to the element you can add *attributes*.

Attribute Examples:

-Disabled

-Value

-Formmethod

-Type

-Name

-Autofocus

Example:

```
<button type="button" disabled="disabled">Click Me!</button>
```

---

---

Inside the **<button>** element you  
can create both text and images  
that are clickable

---

---

# The endless possibilities

- With text and images to click on, we can basically be taken anywhere.
- With the ability to click comes the ability to gather more information.

---

# So what have we learned?

- “The **<button>** tag defines clickable buttons”
  - **<button type="button">Click Me!</button>**
  - Both text and images can be made clickable
  - All major browsers support the **<button>** tag
  - **<button>** allows us to move around within websites
-
